# **Git Cheat Sheet**

#### GIT B SICS

Create empty Git repo in specified directory. Run with no arguments to initialize the current directory as a git repository.	Clone repo located at $\langle repo \rangle$ onto local machine. Original repo can be located on the local filesystem or on a remote machine via HTTP or SSH.	Define author name to be used for all commits in current repo. Devs commonly useglobal flag to set config options for current user.	Stage all changes in ‹directory› for the next commit. Replace ‹directory› with a ‹file› to change a specific file.	Commit the staged snapshot, but instead of launching a text editor, use <message> as the commit message.</message>	List which files are staged, unstaged, and untracked.	Display the entire commit history using the default format. For customization see additional options.	Show unstaged changes between your index and working directory.
git init <directory></directory>	git clone <repo></repo>	git config user.name <name></name>	git add <directory></directory>	git commit -m " <message>"</message>	git status	git log	git diff

## UNDOING CH NGES

Remove <file> from the staging area, but leave the working directory unchanged. This unstages a file without overwriting any changes.</file>	Shows which files would be removed from working directory. Use the -f flag in place of the -n flag to execute the clean.
git reset <file></file>	git clean -n

# **REWRITING GIT HISTORY**

git rebase branch name, a tag, or a relative reference to HEAD.	git commit Replace the last commit with the staged changes and last commit —-amend combined. Use with nothing staged to edit the last commit's message.
	rebase <base/>

### GIT BR NCHES

List all of the branches in your repo. dd a <branch> argument to create a new branch with the name <branch>.</branch></branch>	v branch named <branch>. t an existing branch.</branch>	rent branch.
List all of the branches in your repo. dd a br create a new branch with the name   	Create and check out a new branch named <branch>. Drop the –b flag to checkout an existing branch.</branch>	Merge <branch> into the current branch.</branch>
git branch	git checkout -b <branch></branch>	git merge <branch></branch>

# REMOTE REPOSITORIES

git remote add <name> <url></url></name>	Create a new connection to a remote repo. fter adding a remote, you can use <name> as a shortcut for <ur1> in other commands.</ur1></name>
git fetch <remote> <branch></branch></remote>	Fetches a specific <branch>, from the repo. Leave off <branch> to fetch all remote refs.</branch></branch>
git pull <remote></remote>	Fetch the specified remote's copy of current branch and immediately merge it into the local copy.
git push <remote> <branch></branch></remote>	Push the branch to <remote>, along with necessary commits and objects. Creates named branch in the remote repo if it doesn't exist.</remote>

# dditional Options+

### GIT CONFIG

Define the author name to be used for all commits by the current user.	Define the author email to be used for all commits by the current user.	Create shortcut for a Git command. E.g. alias.glog "log –-graph oneline" will set "git glog" equivalent to "git log –-graph –-oneline.	Set text editor used by commands for all users on the machine. <editor> arg should be the command that launches the desired editor (e.g., vi).</editor>	Open the global configuration file in a text editor for manual editing.
git configglobal user.name <name></name>	git configglobal user.email <email></email>	git config —global alias. <alias-name> <git-command></git-command></alias-name>	git config —system core.editor <editor></editor>	git config globaledit

### GIT LOG

git log - <limit></limit>	Limit number of commits by <limit>. E.g. "git log -5" will limit to 5 commits.</limit>
git logoneline	Condense each commit to a single line.
git log -p	Display the full diff of each commit.
git logstat	Include which files were altered and the relative number of lines that were added or deleted from each of them.
git logauthor= " <pattern>"</pattern>	Search for commits by a particular author.
git log grep=" <pattern>"</pattern>	Search for commits with a commit message that matches <pattern>.</pattern>
git log <since><until></until></since>	Show commits that occur between <since> and <until>. rgs can be a commit ID, branch name, HEAD, or any other kind of revision reference.</until></since>
git log <file></file>	Only display commits that have the specified file.
git loggraph decorate	-graph flag draws a text based graph of commits on left side of commit msgsdecorate adds names of branches or tags of commits shown.

#### GIT DIFF

git diff HEAD	Show difference between working directory and last commit.
git diffcached	Show difference between staged changes and last commit
GIT RESET	
git reset	Reset staging area to match most recent commit, but leave the working directory unchanged.
git resethard	Reset staging area and working directory to match most recent commit and overwrites all changes in the working directory.
git reset <commit></commit>	Move the current branch tip backward to <commit>, reset the staging area to match, but leave the working directory alone.</commit>
git resethard <commit></commit>	Same as previous, but resets both the staging area & working directory to match. <b>Deletes</b> uncommitted changes, and <b>all commits after</b> <commit>.</commit>

### GIT REB SE

#### GIT PULL

Fetch the remote's copy of current branch and rebases it into the local	copy. Uses git rebase instead of merge to integrate the branches.
git pullrebase	<re><re><re><re><re></re></re></re></re></re>

#### **GIT PUSH**

Push all of your local branches to the specified remote.	Tags aren't automatically pushed when you push a branch or use thea11 flag. Thetags flag sends all of your local tags to the remote repo.
jit push <remote> all</remote>	git push <remote> tags</remote>
	git push <remote>all</remote>
